EJCDC No. C-610 (2002 Edition)
Originally prepared through the joint efforts of the Surety Association of America, Engineers Joint Contract Documents Committee, the Associated General Contractors of America, and the American Institute of Architects.

1. Contractor and Surety, jointly and severally, bind themselves, their heirs, executors, administrators, successors, and assigns to Owner for the performance of the Contract, which is incorporated herein by reference.

2. If Contractor performs the Contract, Surety and Contractor have no obligation under this Bond, except to participate in conferences as provided in Paragraph 3.1.

3. If there is no Owner Default, Surety's obligation under this Bond shall arise after:

3.1. Owner has notified Contractor and Surety, at the addresses described in Paragraph 10 below, that Owner is considering declaring a Contractor Default and has requested and attempted to arrange a conference with Contractor and Surety to be held not later than 15 days after receipt of such notice to discuss methods of performing the Contract. If Owner, Contractor and Surety agree, Contractor shall be allowed a reasonable time to perform the Contract, but such an agreement shall not waive Owner's right, if any, subsequently to declare a Contractor Default; and

3.2. Owner has declared a Contractor Default and formally terminated Contractor's right to complete the Contract. Such Contractor Default shall not be declared earlier than 20 days after Contractor and Surety have received notice as provided in Paragraph 3.1; and

3.3. Owner has agreed to pay the Balance of the Contract Price to:

1. Surety in accordance with the terms of the Contract;

2. Another contractor selected pursuant to Paragraph 4.3 to perform the Contract.

4. When Owner has satisfied the conditions of Paragraph 3, Surety shall promptly and at Surety's expense take one of the following actions:

4.1. Arrange for Contractor, with consent of Owner, to perform and complete the Contract; or

4.2. Undertake to perform and complete the Contract itself, through its agents or through independent contractors; or

4.3. Obtain bids or negotiated proposals from qualified contractors acceptable to Owner for a contract for performance and completion of the Contract, arrange for a contract to be prepared for execution by Owner and Contractor selected with Owner's concurrence, to be secured with performance and payment bonds executed by a qualified surety equivalent to the bonds issued on the Contract, and pay to Owner the amount of damages as described in Paragraph 6 in excess of the Balance of the Contract Price incurred by Owner resulting from Contractor Default; or

4.4. Waive its right to perform and complete, arrange for completion, or obtain a new contractor and with reasonable promptness under the circumstances:

1. After investigation, determine the amount for which it may be liable to Owner and, as soon as practicable after the amount is determined, tender payment therefor to Owner; or

2. Deny liability in whole or in part and notify Owner citing reasons therefor.

5. If Surety does not proceed as provided in Paragraph 4 with reasonable promptness, Surety shall be deemed to be in default on this Bond 15 days after receipt of an additional written notice from Owner to Surety demanding that Surety perform its obligations under this Bond, and Owner shall be entitled to enforce any remedy available to Owner. If Surety proceeds as provided in Paragraph 4.4, and Owner refuses the payment tendered or Surety has denied liability, in whole or in part, without further notice Owner shall be entitled to enforce any remedy available to Owner.

6. After Owner has terminated Contractor's right to complete the Contract, and if Surety elects to act under Paragraph 4.1, 4.2, or 4.3 above, then the responsibilities of Surety to Owner shall not be greater than those of Contractor under the Contract, and the responsibilities of Owner to Surety shall not be greater than those of Owner under the Contract. To a limit of the amount of this Bond, but subject to commitment by Owner of the Balance of the Contract Price to mitigation of costs and damages on the Contract, Surety is obligated without duplication for:

6.1. The responsibilities of Contractor for correction of defective Work and completion of the Contract;

6.2. Additional legal, design professional, and delay costs resulting from Contractor's Default, and resulting from the actions or failure to act of Surety under Paragraph 4; and

6.3. Liquidated damages, or if no liquidated damages are specified in the Contract, actual damages caused by delayed performance or non-performance of Contractor.

7. Surety shall not be liable to Owner or others for obligations of Contractor that are unrelated to the Contract, and the Balance of the Contract Price shall not be reduced or set off on account of any such unrelated obligations. No right of action shall accrue on this Bond to any person or entity other than Owner or its heirs, executors, administrators, or successors.

8. Surety hereby waives notice of any change, including changes of time, to Contract or to related subcontracts, purchase orders, and other obligations.

9. Any proceeding, legal or equitable, under this Bond may be instituted in any court of competent jurisdiction in the location in which the Work or part of the Work is located and shall be instituted within two years after Contractor Default or within two years after Contractor ceased working or within two years after Surety refuses or fails to perform its obligations under this Bond, whichever occurs first. If the provisions of this paragraph are void or prohibited by law, the minimum period of limitation available to sureties as a defense in the jurisdiction of the suit shall be applicable.

10. Notice to Surety, Owner, or Contractor shall be mailed or delivered to the address shown on the signature page.

11. When this Bond has been furnished to comply with a statutory requirement in the location where the Contract was to be performed, any provision in this Bond conflicting with said statutory requirement shall be deemed deleted herefrom and provisions conforming to such statutory requirement shall be deemed incorporated herein. The intent is that this Bond shall be construed as a statutory bond and not as a common law bond.

12. Definitions.

12.1 Balance of the Contract Price: The total amount payable by Owner to Contractor under the Contract after all proper adjustments have been made, including allowance to Contractor of any amounts received or to be received by Owner in settlement of insurance or other Claims for damages to which Contractor is entitled, reduced by all valid and proper payments made to or on behalf of Contractor under the Contract.

12.2. Contract: The agreement between Owner and Contractor identified on the signature page, including all Contract Documents and changes thereto.

12.3. Contractor Default: Failure of Contractor, which has neither been remedied nor waived, to perform or otherwise to comply with the terms of the Contract.

12.4. Owner Default: Failure of Owner, which has neither been remedied nor waived, to pay Contractor as required by the Contract or to perform and complete or comply with the other terms thereof.

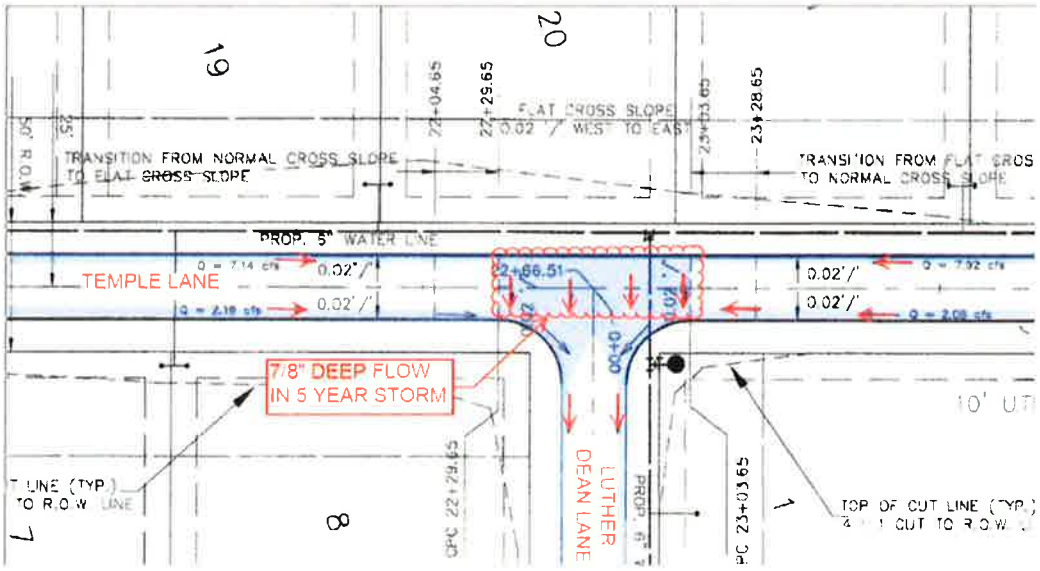
Re: Variance Request
Waverly Place Section 1 (90500-211)
Walker County

Mr. Isbell:

We reviewed a variance request for Waverly Place Section 1. The developer requests Walker County waive the 2% street cross slope requirement on Temple Lane at the intersection of Luther Dean Lane (Subdivision Regulations Exhibit C-1).

The current design transitions from a crowned street section to a super-elevated street section to allow storm water to cross Temple Lane and flow down Luther Dean Lane. In general, street cross drainage is a hazard to traffic, and inlets are typically placed at intersections to eliminate the traffic hazard. Therefore, the applicant provided an engineer's signed and sealed letter to support this request. The engineer calculated a 7/8-inch flow depth across the street during a 5-year storm event. Subdivision Regulations requires cross-street drainage to be designed for a 10-year storm event. The design engineer did not provide the flow depth for the larger storm events, but we can expect the flow depth to increase as the storm intensity increases. The design engineer states these conditions, "will not create or cause a hazard to vehicular traffic operating in a lawful manner." Below is an edited excerpt from the construction plans that show the proposed drainage.



The blue shaded area represents the concentrated flow of storm water, and the red arrow indicates the typical direction the concentrated storm water travels.

It is our opinion that the street cross drainage will negatively impact vehicle traction and potentially increase wet-pavement collisions. In addition, the flow of water over the center joint may reduce the life of the pavement and increase maintenance. It is standard engineering practice to place inlets at intersections. Per the American Society of Civil Engineers publication, Design and Construction of Urban Stormwater Management Systems, "inlets are normally required at intersections to intercept 100% of the runoff. This is necessary to prevent street cross flow, which could cause a traffic hazard. Inlets should generally be placed on tangent curb sections and near corners." Because this a curb and gutter street section, we consider it an urban street design. Therefore, it should be designed as such.

In addition, Walker County Subdivision Regulation 6.1 states that streets shall not be used as drainage courses, and drainage in streets shall be taken to a defined drainage course as directly as possible. In this location, the flow travels approximately 2,250 feet in the street's gutter before it enters an inlet. Walker County's Draft Subdivision Regulations limits gutter flow to 400 feet. Therefore, the flow is not being taken directly to a drainage course, and the length of gutter flow is far greater than what is deemed acceptable. Approximately 450 feet downstream of the intersection is a cross culvert and drainage way. There is a potential to place inlets at the intersection of Temple Lane and Luther Dean Lane and pipe the stormwater about 450 feet to the downstream cross culvert. This scenario will remove the cross-street flow, reduce the depth and volume of water flowing in the gutters, and reduce the length of gutter flow. We would have no objection to the addition of properly designed inlets and storm sewer pipe at this intersection.

RE: Variance Request
Waverly Place Section One (90500-211)
Walker County, Texas

Dear Mr. Isbell:

The owner of the subject property submitted a variance request for that property to waive the 2% street cross slope requirement on proposed Temple Lane at the intersection of proposed Luther Dean Lane. The proposed street design at this location transitions from a crowned street section to a "super-elevated" section or simply a flat 2% cross slope from the east curb line to the west curb line. This proposed design will allow storm water runoff from the west curb line of proposed Temple Lane to flow across proposed Temple Lane to the north and south curb lines of proposed Luther Dean Lane.

The proposed roadway design for Temple Lane provides a 0.7% longitudinal grade on each curb line north of Luther Dean Lane and an approximate grade of 1.8% south of Luther Dean Lane (the profile is in a vertical curve at this location). The tangent grade from the south is 3.567%. The departing grades on Luther Dean Lane from Temple Lane to the east are 1.68% on the north curb line and 1.589% on the south curb line.

The calculate gutter capacity for Temple Lane a 0.7% grade is 9.2 cubic feet per second (cfs) and15.4 cfs for a 1.8% grade. The calculated gutter capacity for the north curb of Luther Dean Lane is 14.9 cfs at a 1.68% grade and the south curb is 14.5 cfs at a 1.589% grade.

The calculated 5-year flow in the west gutter of Temple Lane north of Luther Dean Lane is 7.92 cfs while the calculated 5-year flow in the east gutter is 2.06 cfs. The calculated 5-year flow in the west gutter south of Luther Dean Lane is 7.14 cfs while the calculated 5-year flow in the east gutter of Temple Lane south of Luther Dean Lane is 2.19 cfs.

The 5-year flow in the west gutter of Temple Lane using the proposed street grade will drain across Temple Lane in a sheet flow condition to enter the north and south gutters of Luther Dean Lane. The gutter flows from the west curb line of Temple Lane flowing from west to east on a cross slope of 2% will have a depth of flow of approximately 0.075' or approximately 7/8". This depth of flow for the 2% cross slope provides a flow capacity of 7.97 cfs which is sufficient to handle the 7.92 cfs from the north along Temple Lane and the 7.14 cfs from the south along Temple Lane.

In my opinion, the conditions outlined above will not create or cause a hazard to vehicular traffic operating in a lawful manner. On behalf of the owner, I request approval of the variance request to allow a 2% cross slope from the east curb line to the west curb line of proposed Temple Lane at the intersection with proposed Luther Dean Lane.

Sincerely,

Ronald A. Young, P.E.

ANY CONFLICTS OR ERRORS BETWEEN EXISTING FIELD CONDITIONS AND ENGINEERING PLANS MUST BE RESOLVED PRIOR TO STARTING EXCAVATION OR SETTING ANY GRAVITY SEWER (STORM OR SANITARY) AND APPURTENANCES.

THE DESIGN OF THE PROJECT WILL HAVE NO NEGATIVE EFFECT ON THIS DEVELOPMENT OR ON THE SURFACE WATER ELEVATION AND/OR THE ADJACENT PROPERTIES. NOR WILL THE DESIGN UNREASONABLY:

A) IMPEDE THE NATURAL FLOW OF SURFACE WATERS FROM HIGHER ADJACENT PROPERTIES.

B) ALTER THE NATURAL FLOW OF SURFACE WATERS SO AS TO DISCHARGE THEM UPON ADJACENT PROPERTIES AT A MORE RAPID RATE, IN GREATER QUANTITIES OR IN A DIFFERENT LOCATION THAN WOULD RESULT FROM THE PRE DEVELOPMENT NATURAL FLOW OF SURFACE WATERS;

C) COLLECT OR CONCENTRATE THE FLOW OF SURFACE WATERS FOR DISCHARGE INTO AN EXISTING NATURAL OR ARTIFICIAL DRAINAGE WAY IN A MANNER WHICH EXCEEDS THE CAPACITY OF THE RECEIVING WATER COURSE.

EROSION CONTROL NOTES

1. CONTRACTOR SHALL IMPLEMENT INLET PROTECTION DEVICES AND REINFORCED FILTER FABRIC BARRIER ALONG DRIVE AND SIDE DITCHES AT LOCATIONS SHOWN ON THE TEMPORARY EROSION CONTROL PLAN TO KEEP SILT AND OR EXCAVATED MATERIALS FROM ENTERING INTO THE STORM WATER INLETS AND DITCHES EVENTUALLY POLLUTING THE RECEIVING STREAM.
2. DURING THE EXCAVATION PHASE OF THE PROJECT, CONTRACTOR SHALL SCHEDULE THE WORK IN SHORT SEGMENTS SO THAT EXCAVATION MATERIAL CAN BE QUICKLY HAULED AWAY FROM THE SITE AND TO PREVENT IT FROM STAYING UNCOLLECTED ON THE EXISTING PAVEMENT. ANY LOOSE EXCAVATED MATERIAL WHICH FALLS ON PAVEMENTS OR DRIVEWAYS SHALL BE SWEPT BACK INTO THE EXCAVATED AREA.
3. CONTRACTOR SHALL CLEAN UP THE EXISTING STREET INTERSECTIONS AND DRIVEWAYS DAILY, AS NECESSARY, TO REMOVE ANY EXCESS MUD, SILT OR ROCK TRACKED FROM THE EXCAVATED AREA.
4. CONTRACTOR SHALL FOLLOW GOOD HOUSEKEEPING PRACTICES DURING THE CONSTRUCTION OF THE PROJECT, ALWAYS CLEANING UP DIRT AND LOOSE MATERIAL AS CONSTRUCTION PROGRESSES.

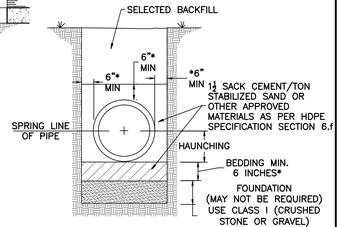
TYP. ROADWAY TRENCH BEDDING



TYP. TRENCH BEDDING

FOUNDATION
A FOUNDATION IS REQUIRED WHEN THE TRENCH BOTTOM IS UNSTABLE. ANY FOUNDATION THAT WILL SUPPORT A RIGID PIPE WITHOUT CAUSING LOSS OF GRADE OR FLEXURAL BREAKING WILL BE MORE THAN ADEQUATE FOR PVC PIPES.

BEDDING
THE BEDDING DIRECTLY UNDERNEATH THE PIPE IS REQUIRED ONLY TO BRING THE TRENCH BOTTOM UP TO GRADE. IT SHOULD NOT BE SO THICK OR SOFT THAT THE PIPE WILL SETTLE AND LOSE GRADE. THE PURPOSE OF THE BEDDING IS TO PROVIDE A FIRM, STABLE AND UNIFORM SUPPORT OF THE PIPE. A LAYER OF MATERIAL SUFFICIENT TO ESTABLISH LINE, GRADE, AND SUPPORT SHOULD BE PLACED. BELL HOLES SHOULD BE EXCAVATED TO ENSURE UNIFORM BEARING.

HAUNCHING
HAUNCHING AND INITIAL BACKFILL ARE THE MOST IMPORTANT AREAS IN TERMS OF LIMITING THE HORIZONTAL DEFLECTION OF A FLEXIBLE PIPE. THESE AREAS SHOULD BE COMPACTED TO REQUIRED OR SPECIFIED DENSITY.

* NOTE: WHEN USING HDPE PIPE, THE BACKFILL MATERIAL SHALL BE CEMENT STABILIZED SAND (1 1/2 SACK CEMENT/TON) OR OTHER APPROVED BACKFILL MATERIAL AS SPECIFIED BY THE ENGINEER, AND IN ACCORDANCE TO CITY OF CONROE HDPE SPECIFICATION, SECTION 6.f FURTHER, THE BACKFILL MATERIAL SHALL BE USED FOR THE WHOLE DEPTH AND WIDTH OF ALL DITCHES, TRENCHES, ETC. UNDER ANY ROADWAY OR PAVED SURFACES. WHEN PIPES ARE NOT UNDER PAVED SURFACES, THE BACKFILL MATERIAL SHALL BE USED TO A MINIMUM OF 6" UNDER AND AROUND THE PIPE, BUT SHALL COVER THE FULL WIDTH OF THE TRENCH TO THE UNDISTURBED WALLS. THE MINIMUM DIMENSION OF THE TRENCH FOR THE HDPE PIPE SHALL BE AS SPECIFIED IN THE HDPE SPECIFICATION, TABLE 6.1.

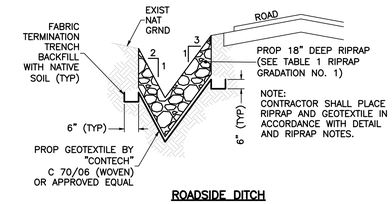
RIPRAP NOTES:
1. PROVIDE RIPRAP CONSISTING OF BROKEN CONCRETE OR STONE. PROVIDE RIPRAP THAT IS DENSE, DURABLE AND HARD MATERIAL FREE FROM CRACKS, SEAMS AND OTHER DEFECTS WHICH WOULD INCREASE DETERIORATION FROM HANDLING AND NATURAL CAUSES. PROVIDE A GEOTEXTILE MATTING BELOW RIPRAP IN ACCORDANCE WITH NOTE 14 BELOW.
2. CONTRACTOR TO PROVIDE ENGINEER 24 HOURS NOTICE TO INSPECT GEOTEXTILE FABRIC PRIOR TO FINAL INSTALLATION OF RIP RAP MATERIAL.
3. PROVIDE RIPRAP IN CUBIC FORM, RATHER THAN ELONGATED (FLAT) SHAPES.
4. PROVIDE RIPRAP WITH A MINIMUM THICKNESS OF 6 INCHES.
5. NO MORE THAN 25 PERCENT SHALL HAVE A LENGTH GREATER THAN 2-1/2 TIMES THE WIDTH OR THICKNESS. NO LENGTH SHALL EXCEED 3 TIMES THE WIDTH OR THICKNESS.
6. WHERE BROKEN CONCRETE IS USED, CUT EXPOSED METAL FLUSH WITH THE SURFACE PRIOR TO PLACING THE RIPRAP.
7. TRIM AND DRESS THE CHANNEL BOTTOM AND SIDE SLOPES TO PROPER LINES AND GRADE PRIOR TO PLACING RIPRAP.
8. PLACE THE RIPRAP TO THE SLOPES, LINES AND GRADES AS SHOWN ON THE PLANS.
9. TO ESTABLISH A WELL-GRADED MASS OF RIPRAP WITH MINIMAL VOIDS, FILL VOIDS BETWEEN LARGER RIPRAP BLOCKS WITH SPALLS AND SMALLER BLOCKS OF THE LARGEST FEASIBLE SIZE TO FORM A COMPACT MASS. DO NOT PLACE SPALLS AND SMALL BLOCKS IN PLACE OF LARGER SIZE RIPRAP.
10. INSTALL RIPRAP MAT TO THE THICKNESS AS SHOWN ON THE PLANS.
11. PLACE THE RIPRAP TO AVOID DISPLACEMENT OR DAMAGE TO THE PREPARED SURFACE OR GEOTEXTILE IN A MANNER TO AVOID SEGREGATION OF PARTICLE SIZES.
12. PROVIDE GEOTEXTILE FIBERS CONSISTING OF LONG CHAIN SYNTHETIC POLYMERS, COMPOSED OF AT LEAST 95 PERCENT BY WEIGHT POLYESTERS OR POLYOLEFINS. THESE FIBERS SHALL BE FORMED INTO A STABLE NETWORK SUCH THAT THE FILAMENTS OR YARNS RETAIN THEIR DIMENSIONAL STABILITY RELATIVE TO EACH OTHER, INCLUDING THE EDGES. MATERIAL SHALL BE RESISTANT TO DETERIORATION FROM ULTRAVIOLET RADIATION, HEAT EXPOSURE AND COMMONLY ENCOUNTERED SOIL CHEMICALS, MILDEW, ROT AND INSECTS.
13. MANUFACTURER RECOMMENDS TO MINIMIZE DAMAGE DUE TO ULTRAVIOLET RADIATION. DO NOT INSTALL A GEOTEXTILE IF IT HAS BEEN REMOVED FROM ITS PROTECTIVE COVERING LONGER THAN THE MANUFACTURER RECOMMENDS.
14. FOR PLACEMENT OF GEOTEXTILE, FOLLOW MANUFACTURER'S INSTALLATION INSTRUCTIONS AND AT A MINIMUM:
    a. PLACE THE GEOTEXTILE DIRECTLY ON THE PREPARED AREA. LAY THE GEOTEXTILE SMOOTHLY ON THE SUBGRADE TO MINIMIZE TENSION, STRESS, FOLDS AND WRINKLES.
    b. AFTER PLACEMENT, DO NOT UNNECESSARILY WALK ON OR DISTURB THE GEOTEXTILE UNLESS REQUIRED TO PRESERVE CONTACT WITH THE SUBGRADE. EQUIPMENT IS NOT ALLOWED ON THE UNPROTECTED GEOTEXTILE. PROTECT THE GEOTEXTILE FROM CLOGGING, PENETRATIONS, TEARS AND OTHER DAMAGE DURING INSTALLATION.
    c. PLACE THE GEOTEXTILE STRIPS FROM DOWNSTREAM TO UPSTREAM. OVERLAP SUCCESSIVE GEOTEXTILE SHEETS SUCH THAT THE UPSTREAM SHEET IS PLACED OVER THE DOWNSTREAM SHEET AND/OR THE UPSLOPE OVER THE DOWNSLOPE.
    d. OVERLAP ADJOINING GEOTEXTILE SECTIONS A MINIMUM OF 2 FEET.
    e. REPLACE OR REPAIR ANY GEOTEXTILE DAMAGED DURING THE PLACEMENT OF RIPRAP OR OTHER MATERIALS AT NO ADDITIONAL COST TO THE DISTRICT. PLACE A GEOTEXTILE PATCH OF THE SAME MATERIAL OVER THE AREA AND EXTEND A MINIMUM OF 3 FEET BEYOND THE PERIMETER OF THE TEAR AND/OR DAMAGE. ORIENT THE PATCH MATERIAL SO THAT ITS FIBERS ARE ALIGNED WITH THE DAMAGED GEOTEXTILE FIBERS.
15. USE EVENLY GRADED, RIPRAP PER TABLE 1 BELOW.



NOTE: CONTRACTOR SHALL PLACE RIPRAP AND GEOTEXTILE IN ACCORDANCE WITH DETAIL AND RIPRAP NOTES.

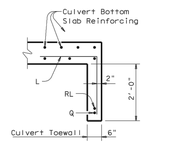
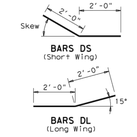
FOOTING AND TOEWALL

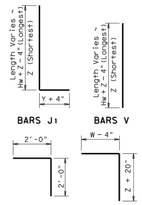


SECTION B-B (5)

CORNER DETAILS
(Culvert and Culvert Toewall reinforcing not shown for clarity.)



(1) Extend Bars P 3'-0" minimum into bottom slab of Box Culvert.
(2) Adjust to fit as necessary to maintain 1 ¼" clear cover and 4" minimum between bars.
(3) Quantities shown are based on an average wing height for two wings (one structure end). To determine total quantities for two wings multiply the tabulated values by 0.5 x (A+Lw).
(4) Recommended values of Slope are: 2:1, 3:1, 4:1, & 6:1.
(5) When shown elsewhere on the plans, a 5" deep concrete riprap shall be constructed. Payment for riprap shall be as required by Item 432, "Riprap". Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 6" wide by 1'-6" deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 20'. When such riprap is provided, the culvert toewall shown in SECTION B-B will not be required.
(6) At Contractor's option, Culvert Toewall may be ended flush with Wingwall Toewall. Adjust reinforcing from that shown as necessary.
(7) Applicable values of of Skew are: 15°, 30°, and 45°.
(8) Typical wingwall angle for all skews.
(9) 0° min to 5'-0" max. Estimated curb heights are shown elsewhere in the plans. For structures with pedestrian rail, bicycle rail or curbs taller than 1'-0", refer to ECD standards. For structures with T6 bridge rail, refer to T6-CM standard. For structures with traffic rail, other than T6, refer to RAC standards.
(10) For vehicle safety, curb heights and wall heights shall be reduced, if necessary, to provide a maximum 3" projection above finished grade. No changes will be made in quantities and no additional compensation will be allowed for this work.



GENERAL NOTES:
Designed according to AASHTO LRFD Specifications.
All reinforcing steel shall be Grade 60.
Synthetic fibers listed on the "Fibers for Concrete" Material Producer List (MPL) may be used in lieu of steel reinforcing in riprap concrete unless noted otherwise.
All concrete shall be Class "C" and shall have a minimum compressive strength of 3600 psi.
All reinforcing bars shall be adjusted to provide a minimum of 1 ¼" clear cover.
When structure is founded on solid rock, depth of toewalls for culverts and wingwalls may be reduced or eliminated as directed by the Engineer.
See BCS sheet for additional dimensions and information.
The quantities for concrete and reinforcing steel resulting from the formulas given on this sheet are for Contractor's information only.

TYP. TRENCH BEDDING

FOUNDATION
A FOUNDATION IS REQUIRED WHEN THE TRENCH BOTTOM IS UNSTABLE. ANY FOUNDATION THAT WILL SUPPORT A RIGID PIPE WITHOUT CAUSING LOSS OF GRADE OR FLEXURAL BREAKING WILL BE MORE THAN ADEQUATE FOR PVC PIPES.

BEDDING
THE BEDDING DIRECTLY UNDERNEATH THE PIPE IS REQUIRED ONLY TO BRING THE TRENCH BOTTOM UP TO GRADE. IT SHOULD NOT BE SO THICK OR SOFT THAT THE PIPE WILL SETTLE AND LOSE GRADE. THE PURPOSE OF THE BEDDING IS TO PROVIDE A FIRM, STABLE AND UNIFORM SUPPORT OF THE PIPE. A LAYER OF MATERIAL SUFFICIENT TO ESTABLISH LINE, GRADE, AND SUPPORT SHOULD BE PLACED. BELL HOLES SHOULD BE EXCAVATED TO ENSURE UNIFORM BEARING.

HAUNCHING
HAUNCHING AND INITIAL BACKFILL ARE THE MOST IMPORTANT AREAS IN TERMS OF LIMITING THE HORIZONTAL DEFLECTION OF A FLEXIBLE PIPE. THESE AREAS SHOULD BE COMPACTED TO REQUIRED OR SPECIFIED DENSITY.

* NOTE: WHEN USING HDPE PIPE, THE BACKFILL MATERIAL SHALL BE CEMENT STABILIZED SAND (1 1/2 SACK CEMENT/TON) OR OTHER APPROVED BACKFILL MATERIAL AS SPECIFIED BY THE ENGINEER, AND IN ACCORDANCE TO CITY OF CONROE HDPE SPECIFICATION, SECTION 6.1 FURTHER, THE BACKFILL MATERIAL SHALL BE USED FOR THE WHOLE DEPTH AND WIDTH OF ALL DITCHES, TRENCHES, ETC. UNDER ANY ROADWAY OR PAVED SURFACES. WHEN PIPES ARE NOT UNDER PAVED SURFACES, THE BACKFILL MATERIAL SHALL BE USED TO A MINIMUM OF 6" UNDER AND AROUND THE PIPE, BUT SHALL COVER THE FULL WIDTH OF THE TRENCH TO THE UNDISTURBED WALLS. THE MINIMUM DIMENSION OF THE TRENCH FOR THE HDPE PIPE SHALL BE AS SPECIFIED IN THE HDPE SPECIFICATION, TABLE 6.1.

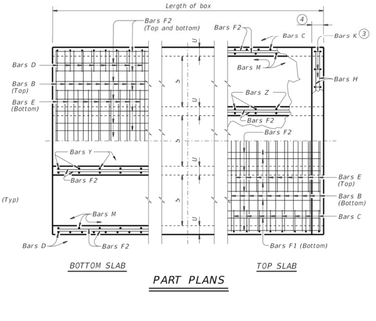
TYPICAL SECTION



BOTTOM SLAB — PART PLANS — TOP SLAB

1. 0" Min to 5'-0" Max. Estimated curb heights are shown elsewhere in the plans. For structures with pedestrian rail or curbs taller than 1'-0", refer to the Extended Curb Details (ECD) standard sheet. For structures with T631 or T631LS bridge rail, refer to the Mounting Details for T631 & T631LS Rails (T631-CM) standard sheet. Refer to the Rail Anchorage Curb (RAC) standard sheet for structures with bridge rail other than T631 or T631LS.
2. For vehicle safety, the following requirements must be met:
   - For structures without bridge rail, construct curbs no more than 3" above finished grade.
   - For structures with bridge rail, construct curbs flush with finished grade.

   Reduce curb heights, if necessary, to meet the above requirements. No changes will be made in quantities and no additional compensation will be allowed for this work.
3. For curbs less than 1'-0" high, flat Bars K or reduce bar height as necessary to maintain cover. For curbs less than 3" high, Bars K may be omitted.
4. 1'-0" typical. 2'-3" when the Rail Anchorage Curb (RAC) standard sheet is referred to elsewhere in the plans.

The Contractor may replace Bars B, C, D, E, F1, F2, H, Y, and/or Z with deformed welded wire reinforcement (WWR) meeting the requirements of ASTM A1064. The area of required reinforcement may be reduced by the ratio of 60 ksi / 70 ksi. Spacing of WWR is limited to 4" Min and 18" Max. When required, provide lap splices in the WWR of the same length required for the equivalent bar size, rounded up for wire sizes between conventional bar sizes. The lap length required for WWR is never less than the lap length required for uncoated #4 bars.

Example conversion: Replacing No. 6 Gr 60 at 6" Spacing with WWR
Required WWR = (0.44 sq. in. per 0.5 ft.) x (60 ksi / 70 ksi) = 0.755 sq. in. per ft.
If D30.6 wire is used to meet the 0.755 sq. in. per ft. requirement in this example, (the required spacing = (0.306 sq. in.) / (0.755 sq. in. per ft.)) x (12 in. per ft.) = 4.86" Max spacing. Required lap length for the provided D30.6 wire is 2'-3" (the same minimum lap length required for uncoated #5 bars, as listed under MATERIAL NOTES).

CONSTRUCTION NOTES:
Do not use permanent forms.
Chamfer the bottom edge of the top slab 3" at the entrance.
Optionally, raise construction joints shown at the flow line by a maximum of 6". If this option is taken, Bars W may be cut off or raised, Bars C and D may be reversed, and Bars Y and Z may be reversed.

MATERIAL NOTES:
Provide Grade 60 reinforcing steel.
Provide galvanized reinforcing steel if required elsewhere in the plans.
Provide Class C concrete (f'c = 3,600 psi) for culvert barrel and curb.
Provide bar laps, where required, as follows:
- Uncoated or galvanized – #4 = 1'-8" Min
- Uncoated or galvanized – #5 = 2'-1" Min
- Uncoated or galvanized – #6 = 2'-6" Min

GENERAL NOTES:
Designed according to AASHTO LRFD Bridge Design Specifications for the range of fill heights shown.
See the Multiple Box Culverts Cast-In-Place Miscellaneous Detail (MC-MD) standard sheet for details pertaining to skewed ends, angle sections, and lengthening.

Cover dimensions are clear dimensions, unless noted otherwise.
Reinforcing bar dimensions shown are out-to-out of bar.
